

While you're out enjoying everything Summer has to offer, our team has been hard at work keeping you safe. We've braved the Texas heat and used creative problem-solving to navigate around existing worksite structures, all to ensure top-quality, reliable protection.

A South Texas railcar repair facility partnered with us to enhance worker safety across ten maintenance bays.

Installing enclosed track fall protection systems in eight of the bays. In the remaining two bays, a custom-engineered multi-span horizontal lifeline system was implemented. These ensure that every bay is equipped with effective, OSHA-compliant fall protection, keeping crews safe while they keep the railcars rolling.

SES paired up with a Midwest engineering and manufacturing firm to install fall protection over their transformer assembly areas.

There was an overhead bridge crane, so the project was split into two phases: jib arms were added in three bays, and multi-span horizontal lifelines were installed in three others. The result? A safer workspace without disrupting production flow.

Safety Is Our Business.
